Notes on the Indices of Agricultural Production

The attache tables present revised indices of agricultural production for selected countries of Africa. These indices were calculated on a 1957-59 base and include total production data (unless otherwise noted) for year 1954 through 1966. They represent the latest production estimates as of the date appearing on the upper right corner of each country table.

Production figures for the major crops used in preparing these indices are drawn from the periodic commodity reports published by the Foreign Agricultural Service (FAS) of the U.S. Department of Agriculture. When figures were unavailable from FAS, data were compiled from official government sources within the country or from U.S. agricultural attache reports. If no data from these sources were available, the country specialist, Economic Research Service, U.S.D.A. made his own estimate based upon past trends and knowledge of the country situation. Judgment is the dominant factor, and some of these figures are subject to a wide range of error.

The time period designation is a calendar year and represents the years of harvest of most crops grown in this area. However, it does include some crops for which the harvest continues into the early part of the next year.

In the case of coffee and cocoa beans, the production of which is reported by Foreign Agricultural Service for crop years beginning for most countries in Africa about September or October, the entire crop has been assigned to the calendar year in which the harvest began. This is because, for the continent as a whole, the bulk of the harvesting occurs before December 31.

The weights used in computing country indices are estimates of the average price (in dollars) per metric ton received by producers of that country during the 1957-59 base period. More recent price data were used for some countries where adequate price data were not available for the base years. When farm prices were not available, it was necessary to use wholesale or export prices, adjusting to make them comparable to farm level. The inadequacy of price statistics for this region is well known, so all weights are subject to revision as better data are received.

To calculate the indices for each country, the production of each commodity in 1,000 metric tons was multiplied by the price weight and the resulting extension rounded to the nearest $100,000. Crop extensions were then summed for each year, as were the livestock extensions. An estimate of the crop production that was fed to livestock was subtracted from this. The latter step was an attempt to eliminate double counting. The resulting agricultural production aggregates were divided by the aggregate for the base period to obtain the agricultural production index for each year. The per capita indices were obtained by dividing the indices of total agricultural production by the population indices.

The same procedure was followed in calculating the food production index, but only edible commodities were used. All commodities are considered edible except tobacco, tea, coffee, chicory, pepper, cloves, castor beans, flaxseed, vanilla, cotton lint, rubber, sisal, quinine bark, urena and punga, piassava, wool, mohair, tung oil, hides and skins, and pyrethrum flowers. Because no consideration was taken of changes in stocks, foreign trade, seed, and waste, the indices of total and per capita food production are not be be regarded as indices of consumption.

Not all crops and livestock products produced in a country are necessarily report. Only those with significant production or where a reasonable estimate of production could be made were used.

* ERS Washington estimate.
1/ Less than 500.
2/ Excluding sulphur oil.
3/ Oil pressed in marketing season beginning November 1.
4/ Harvest extends into the following year.
5/ About half goat milk, most of the remainder fairly equal parts of cow milk and sheep milk.
6/ About 10 percent pork, the rest is roughly equal amounts of beef and veal, mutton and lamb.

* ERS estimate.

1/ Cow's milk is of first importance, followed by sheep, goat, and camel.

2/ Estimated at about 40 percent cattle, 20 percent sheep, 15 percent goat, 10 percent camel, and the remainder is made up of poultry and other meat.

* ERS Washington estimate.
1/ Excludes sulphur oil.
2/ Oil pressed in marketing season beginning November 1.
3/ Covers Tripolitania only.
4/ Harvest extends into the following year.
5/ Goat's milk equals over 40 percent, sheep's milk about 30 percent, cow's milk 20 percent, the remainder is camel's milk.
6/ About two-thirds sheep and goats. Remainder largely camels and cattle.
7/ Less than 500 metric tons.

* ERS estimate.
1/ Excluding sulphur oil.
2/ Oil pressed in marketing season beginning November 1.
3/ Largest portion composed of cow milk, followed by goat, sheep, and camel.
4/ Eighty percent fairly equally divided between beef and veal, mutton and lamb with remaining 20 percent as other.
5/ Less than 500.
6/ Heavy selling of livestock reported.

* ERS estimate.

1/ Harvest extends into the following year.
2/ Estimated at about 40 percent cattle, 20 percent sheep, 15 percent goat, 10 percent camel, and 15 percent other meat.
3/ Cow's milk is of first importance, followed by sheep, goat, and camel.

* ERS Washington estimate
1/ Excluding sulphur oil
2/ Oil pressed in marketing season beginning November 1
3/ Cows milk is first in importance followed by goat and sheep.
4/ About two-thirds mutton and lamb. The remainder principally beef and veal. Poultry is increasing.
5/ Grape acreage reported cut 40%, fertilizer withheld, and drought effects are expected to cut production 30%.
6/ Heavy livestock slaughter because of drought.
